The history of the rate of progression in individual patients is important to obtain to predict prognosis. Describe progression/dates: ____________________________________________________________________________  ____________________________________________________________________________  

• In end-state ALS, two factors are critical in determining prognosis: ability to breathe, and to a lesser extent ability to swallow. The former can be managed by artificial ventilation, and the latter by gastrostomy or other artificial feeding, unless the patient has recurrent aspiration pneumonia. While not necessarily a contraindication to Hospice Care, the decision to institute either artificial ventilation or artificial feeding will significantly alter six-month prognosis.

• Examination by a neurologist within three months of assessment for hospice is advised, both to confirm the diagnosis and to assist with prognosis.

CRITERIA:
Patients will be considered to be in the terminal stage of ALS (life expectancy of six months or less) if they meet the following criteria. **(Should fulfill 1, 2, or 3)**.

1. Patient should demonstrate critically impaired breathing capacity.
   - Critically impaired breathing capacity as demonstrated by all the following characteristics occurring within the 12 months preceding initial hospice certification:
     - Vital capacity (VC) less than 30% of normal (if available);
     - Dyspnea at rest;
     - Patient declines mechanical ventilation; external ventilation used for comfort measures only.

2. Patient should demonstrate both rapid progression of ALS and critical nutritional impairment.
   A. Rapid progression of ALS as demonstrated by all the following characteristics occurring within the 12 months preceding initial hospice certification:
      - Progression from independent ambulation to wheelchair to bed bound status;
      - Progression from normal to barely intelligible or unintelligible speech;
      - Progression from normal to pureed diet;
      - Progression from independence in most or all activities of daily living (ADLs) to needing major assistance by caretaker in all ADLs.
   
   B. Critical nutritional impairment as demonstrated by all the following characteristics occurring within the 12 months preceding initial hospice certification:
      - Oral intake of nutrients and fluids insufficient to sustain life;
      - Continuing weight loss;
      - Dehydration or hypovolemia;
      - Absence of artificial feeding methods, sufficient to sustain life, but not for relieving hunger.

3. Patient should demonstrate both rapid progression of ALS and life-threatening complications.
   - Rapid progression of ALS, see 2.a above.
   - Life-threatening complications as demonstrated by one of the following characteristics occurring within the 12 months preceding initial hospice certification:
     - Recurrent aspiration pneumonia (with or without tube feedings);
     - Upper urinary tract infection, e.g., pyelonephritis;
     - Sepsis;
     - Recurrent fever after antibiotic therapy;
     - Stage 3 or 4 decubitus ulcer(s).
